

The **Vector 2D** is a **Partner/Aspan** option module, which transforms an image (.bmp, .jpg, .tiff, etc.) into workable profiles.

The image can contain any type of subject, for example an artistic drawing, a logo, a symbol, a geometric drawing, it can be either in color or in black and white.

Vector 2D transforms and groups the points (pixels) of the image into lines and arcs connecting the various entities to each other.

If necessary it is possible to make changes in the **CAD** environment, to obtain the required result.

Once the processing has been performed, the result obtained is a normal **Partner/Aspan** drawing that can be modified, scaled, rotated, assigned to tools and machined.

It is also possible to pre-select, during processing, which points of the image to consider, using a special filter, and display a preview of the result.
